17 The enforcement of security policies for computation   100%

Anita K. Jones , Richard J. Lipton

Proceedings of the fifth ACM symposium on Operating systems principles November 1975

Security policies define who may use what information in a computer system. Protection mechanisms are built into a system to enforce security policies. In most systems, however, it is quite unclear what policies a mechanism can or does enforce. This paper defines security policies and protection mechanisms precisely and bridges the gap between them with the concept of soundness: whether a protection mechanism enforces a policy. Different sound protection mechanisms for the same p ...

18 Protection in an information processing utility   100%

Robert M. Graham

Proceedings of the first ACM symposium on Operating System Principles January 1967

In this paper we will define and discuss a solution to some of the problems concerned with protection and security in an information processing utility. This paper is not intended to be an exhaustive study of all aspects of protection in such a system. Instead, we concentrate our attention on the problems of protecting both user and system information (procedures and data) during the execution of a process. We will give special attention to this problem when shared procedures and data are p ...
